ABSTRACT OF THE DISCLOSURE

There is provided an image forming apparatus including a digital printing device that prints an image according to image signals and a digital scanning device, connectable to the digital printing device, that scans an image and converts the image into electric signals. The digital printing device includes a first nonvolatile memory for storing first parameters that optimize performance of the digital printing device. The digital scanning device includes a second nonvolatile memory for storing second parameters that optimize performance of the digital scanning device. The digital printing device includes a section for modifying the second parameters when the digital scanning device is connected to the digital printing device.
